Dash Components

After completing the lab you will be able to:

- Know how to add multiple graphs to the dashboard
 Work with Dash Callbacks to handle multiple output

ted time needed: 30 minutes

Dataset Used

About Skills Network Cloud IDE

This Skills Network Labs Cloud IDE (Integrated Development Environment) provides a hands-on environment in your web browser for completing course and project related labs. It utilizes Theia, an open-source IDE platform, that can be run on desktop or on the cloud So far in the course you have been using Jupyter notebooks to run your python code. This IDE provides an alternative for editing and running your Python code. In this lab you will be using this alternative Python runtime to create and launch your Dash applications.

Important Notice about this lab environment

Please be aware that sessions for this lab environment are not persisted. When you launch the Cloud IDE, you are presented with a 'dedicated computer on the cloud' exclusively for you. This is available to you as long as you are actively working on the labs.

Once you close your session or it is timed out due to inactivity, you are logged off, and this 'dedicated computer on the cloud' is deleted along with any files you may have created, dowloaded or installed. The next time you launch this lab, a new enviror

Let's start creating dash application

Theme

Analyze flight delays in a dashboard

Dashboard Components

- Monthly average carrier delay by reporting airline for the given year.
 Monthly average weather delay by reporting airline for the given year.
 Monthly average national air system delay by reporting airline for the given whomthly average security delay by reporting airline for the given year.
 Monthly average saceutify delay by reporting airline for the given year.

NOTE: Year range should be between 2010 and 2020

Expected Output

Below is the expected result from the lab. Our dashboard application consists of three corr

- ** Talle of the application

 ** Component to enter input year

 ** Contract convolve the different types of flight delay. Chan section is divided into three segments.

 ** Currier and Weather delay in the first segment

 ** National air system and Security delay in the second segment

 ** Late aircraft delay in the third segment

Flight Delay Time Statistics Title

- Design layout for the application.
 Create a callback function. Add callback decorator, define inputs and outputs.
 Review the helper function that performs computation on the provided inputs.
 Create Sine graphs.
 Run the application.

Get the tool ready

10/8/23, 10:23 PM 1 of 6

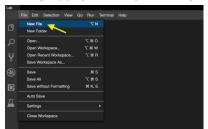

```
1. python3 -m pip install packaging
Copied!

1. 1

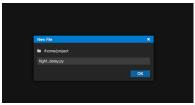

1. python3 -m pip install pandas dash
```

```
ts pip3 install httpx==0.20 dash plotly pip3 install httpx==0.20 dash plotly pip3 install httpx==0.20 dash plotly

ttal:-components-2.4.0 py3-none-any.ahl (4.9 kB)
```

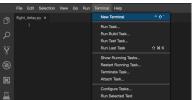

Create a new python script, by clicking on the menu bar and selecting File. New File, as in the image below.

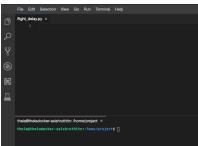

Provide the file name as flight_details.py

Open a new terminal, by clicking on the menu bar and selecting Terminal.->New Terminal, as in the image below.

TASK 1 - Read the data

Copy the below code to the flight_delay.py script and review the code.

10/8/23, 10:23 PM 2 of 6

```

6. 6
7. 7
8. 8
9. 9
10. 10
11. 11
12. 12
13. 13
14. 14
    1... 14
2 Import required libraries
2. import pandas as pd
2. import pandas as pd
4. import dash, objects as go
4. import dash, that, components as html
6. import dash, core components as dcc
7. from dash, dependencies import Imput, Output
8. import plotly.express as px
9.
   9.
10. # Read the sirline data into pandas dataframe
11. airline_data = pd.read_csv(https://cf-courses-data.slus.cloud-object-stor
12. rline_data = pd.read_csv(https://cf-courses-data.slus.cloud-object-stor
13. dtpse={bivAirport:str, bivIsTalbNum:str, bivIsTalbNum
Copied!
 TASK 2 - Create dash application and get the layout skeleton

Title of the application
Component to enter input year inside a layout division
In the conveying the different types of flight delay
 Mapping to the respective Dash HTML tags:
 Copy the below code to the flight_delay.py script and review the structure.
 NOTE: Copy below the current code
     1. # Create a dash application
2. app = dash.Dash(__name__)
  html.Div(, style={'width':'65%'})
])
Copied!
NOTE: We are using display as flex for two outer divisions to get graphs side by side in a row.
TASK 3 - Update layout components

    Title as Flight Delay Time Statistics, align text as center, color as #503D36, and font size as 30.

 Input component

    Update dec.Input component id as input-year, default value as 2010, and type as number. Use style parameter and assign height of the input box to be 35px and font-size to be 30

 Output component - Segment 1
 Segment 1 is the first html.Div(). We have two inner division where first two graphs will be placed.
Copied!

    Add dcc.Graph() component.
    Update dcc.Graph component id as carrier-plot

 Output component - Segment 2
 Segment 2 is the second html. Div(). We have two inner division where the next two graphs will be placed.
    1. html.Div([
2. html.Div(),
3. html.Div()
4. ], style={'display': 'flex'}),
Copied!

    Add dcc.Graph() component.
    Update dcc.Graph component id as nas-plot.

 Output component - Segment 3
 Segment 3 is the last html.Div().
   1. 1
1. html.Div(, style={'width':'65%'})
 Copied!
 TASK 4 - Review and add supporting function
 Copy the below code to the flight_delay.py script and review the structure.
 NOTE: Copy below the current code
```

22. 22
                              This function takes in airline data and selected year as an input and performs computation for creating charts and plots.
                            Arguments:
. airline_data: Input airline data.
. entered_year: Input year for which computation needs to be performed.
              8.

9. Returns:
18. Computed average dataframes for carrier delay, weather delay, NAS delay, security delay, and late aircraft delay.
19. Computed average dataframes for carrier delay, weather delay, NAS delay, security delay, and late aircraft delay.
The control of the compute average dataframes to two man.

11. set
11. set
12. set
12. set
13. set
14. selected data
15. set
15. set
16. set
1
```

TASK 5 - Add the application callback function The core idea of this application is to get year as user input and update the dashboard in real-time. We will be using callback function for the same Define the callback function that uses the input provided to perform the computation
 Create graph and return it as an output
 Run the application Copy the below code to the flight_delay.py script and review the structure. NOTE: Copy below the current code 1. 1 2. 2 3. 3 4. 4 5. 5 6. 6 7. 7 8. 8 9. 9 10. 10 11. 11 12. 12 13. 13 14. 14 15. 15 16. 16 17. 17 18. 18 19. 19 20. 20 21. 21 22. 22 23. 23 24. 24 25. 25 26. 26 27. 27 28. 28 29. 29 30. 30 31. 31 31. 31.
 # Callback decorator
 @app.callback([
 0utput(component_id='carrier-plot', component_property='figure'), # Compute required information for creating graph from the data avg_car, avg_weather, avg_MAS, avg_sec, avg_tate = compute_info(airline_data, entered_year)

TASK 6 - Update the callback function

return[carrier_fig, weather_fig, nas_fig, sec_fig, late_fig]

Copied!

- Refer examples provided laza.

 We have 5 output components added in a list. Update output component id parameter with the lest provided in the dee_Graph() component and set the component property as figure. One sample has been added to the skeleton

 Update input component id parameter with the id provided in the dec_Input() component and component property as value.

Callback function

Next is to update the get_graph function. We have already added a function compute_info that will perform computation on the data using the input

Mapping the returned value from the function compute_info to graph:

- avg_car input for carrier delay
 avg_weather input for weather delay
 avg_MAS input for NAS delay
 avg_sec input for security delay
 avg_late input for late aircraft delay
- Code has been provided for plotting carrier delay. Follow the same process and use the above mapping to get plots for other 4 delays.

Refer to the full code of 4.8_Flight_Delay_Time_Statistics_Dashboard.py

10/8/23, 10:23 PM 4 of 6

```
useo. 100

1. # Import required libraries

2. import pandas as pd

3. import dash

4. import dash, html_components as html

5. import dash, html_components as dcc

6. from dash, deependencies import Imput, Output

7. import plotly.express as px

6.

    # Read the airline data into pandas dataframe
    airline_data = pd.read_csv('https://cf-cours

                                                                                                                                                                                       | 15. # Create a dash application | 15. 
                            This function takes in airline data and selected year as an input and performs computation for creating charts and plots.
                            Returns:

Computed average dataframes for carrier delay, weather delay, NAS delay, security delay, and late aircraft delay.
                                            rections and a second s
                                    """Callback Function
                            Function that returns fugures using the provided input year.
                          . ],
Input(component_id='input-year', component_property='value'))
. # Computation to callback function and return graph
. def get_graph(entered_year):
